AgentDispatcher

By BiSkilled

Know where your AI spend goes.

Bring application calls, scheduled workloads and supported coding accounts into one view. See who uses what, and track spending against budget.

Understand application costs

Compare apps, features, users and models. Inspect reported input, output, cache and reasoning tokens.

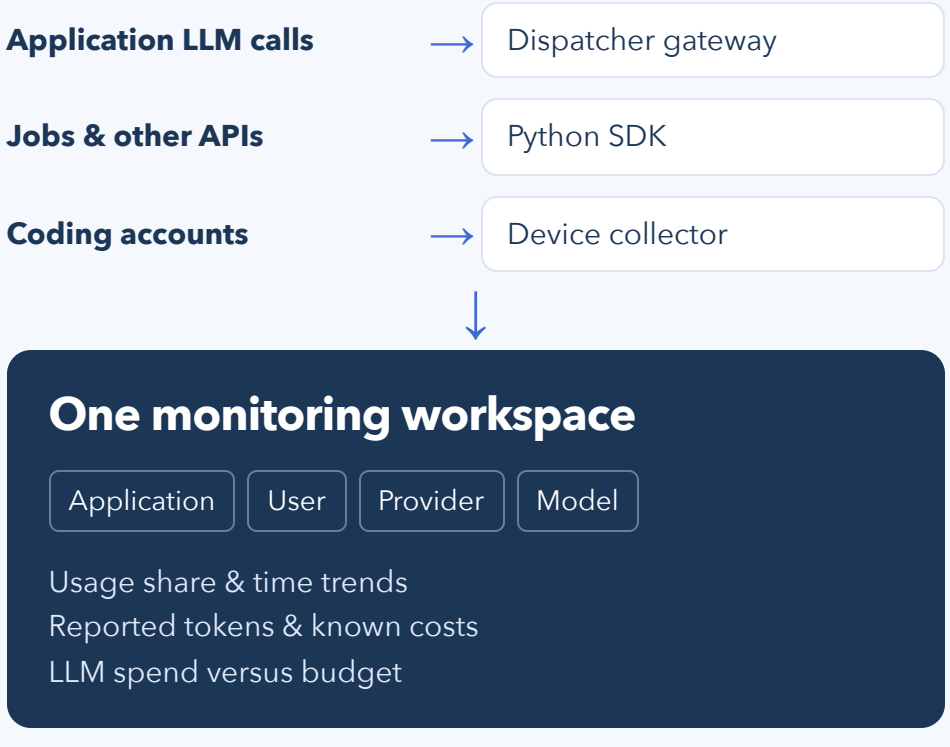

Keep background work visible

Track scheduled LLM calls through the gateway. Add SDK reporting for job health and other API usage.

Control access and sensitive input

Limit agent tasks and tools. Enable input masking or blocking per application. Review usage on desktop or mobile.

Connect the work you already run

Gateway calls need no monitoring SDK. The collector works alongside your existing coding tools.

Testing preview. Costs are estimates, not invoices. CLI account snapshots are separate from request charges; coverage depends on supported tools and configured identity. Input protection requires configured detection services.

Built with maintained open-source projects. Component credits and licenses are included in distribution notices.

Start with one application.
